We are surrounded by the ghosts of cows.

Cattle byproducts proliferate through our economy, showing up in unexpected places, like flexible plastics, textiles, and metals manufacturing.

Most people know about the evils of factory farming, but most people don't realize how difficult it is to opt out of our entanglement between cow, consumer, and corporation. Everywhere Cows is an exercise in complicity, an early awareness campaign, and the beginnings of a virtual geography of the supply chains that drive our cattle-based economy.

With Temple Grandin's cattle chute as a spatial conceit, the user guides an object through a series of products. When the object touches the products, a title reveals the ingredient in that product's composition or manufacturing that is likely to be derived from cattle. The user can do this for two minutes.

The next sequence rotates point of view from plan to perspective. Instead of looking at the cattle chute from bird's eye view, the user is shifted to cow's eye view, and has to navigate through the chute. The user can only go in one direction, forward.

This reveals a landing page, which gives the user access to the product library, exposition on the project, a little more information about the byproduct production process, and depending on which path the user takes through those pages, they're likely to get shuttled back to the beginning of the chute to begin the sequence over again.
